In-orbit and Hypersonic Re-entry Control by Deployable Technologies

2nd International Symposium:
“Hypersonic Flight: from 100.000 to 400.000 ft”
Rome, Italy, 30th June-1st July 2016

01/07/16 2nd Hypersonic International Symposium - Rome - 30 June-1 July 2016 1

Outline

- Deployable aero-brakes technology main capabilities
- Possible missions offered by these systems
- Programmes and developments
- Conclusions

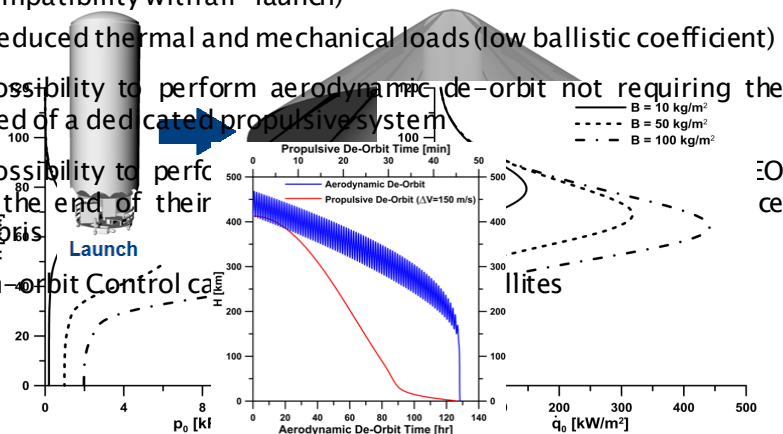

Rome, 30th June – 1st July 2016 2

Introduction

Deployable re-entry capsules key features:

- Easy accommodation in launch vehicles in folded configuration (compatibility with air-launch)
- Reduced thermal and mechanical loads (low ballistic coefficient)
- Possibility to perform aerodynamic de-orbit not requiring the need of a dedicated propulsive system
- Possibility to perform propulsive de-orbit at the end of their mission
- In-orbit Control capabilities

Rome, 30th June – 1st July 2016

3

Possible missions

- Recovery of small payloads** (mass of the order of a few kilograms and volume of the order of a few liters) **from the ISS**;
- Scientific Space Missions** (study the effects of microgravity in the fields of physical and life sciences);
- Probe Space Missions** to analyze the upper atmosphere over a very large area, even on a global scale in case of a polar orbit;
- Earth Observation Missions** (possibility to reach the selected target as soon as possible and to safely retrieve data recorded on board);
- Catch Debris Missions** (the satellite would chase the selected debris, capture it and finally re-enter the atmosphere activating the shield so to safely reach the selected target location);
- Martian Missions** (futuristic), to transfer pieces of equipment on the Martian surface.

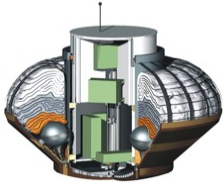

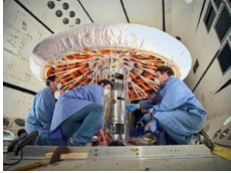

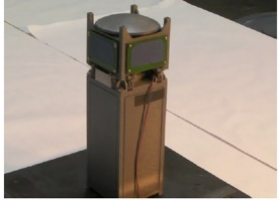

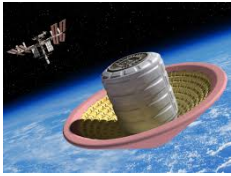

Rome, 30th June – 1st July 2016

State-of art inflatable and deployable

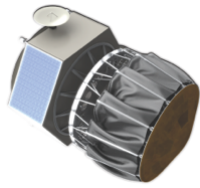

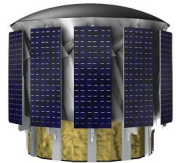

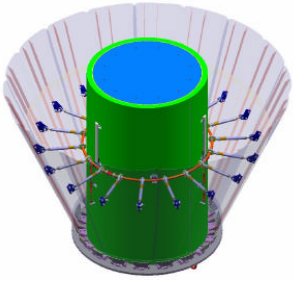

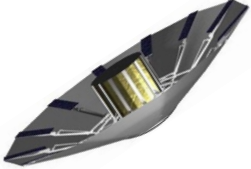

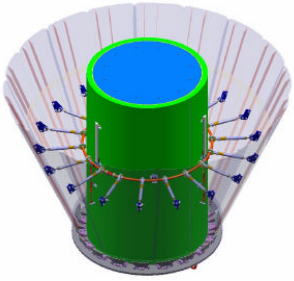

IRDT	IRVE	DRS
		
		
Successful launch in 2000	Successful launch in 2003	Patented in 2012

Rome, 30th June – 1st July 2016 July 2016 5

State-of art inflatable and deployable

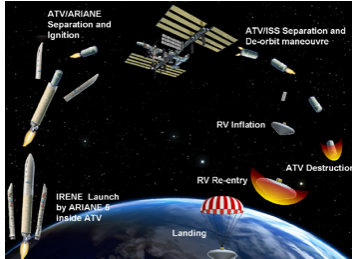

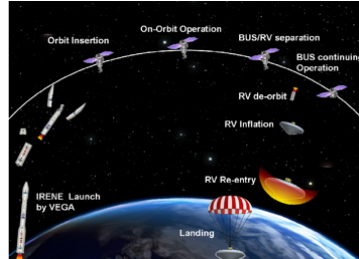

ADEPT	Bremsat	PARES
		
		
Transformable Entry System Technology	Designed in 1996	Designed since 2004

Rome, 30th June – 1st July 2016 July 2016 6

IRENE Technological Project

It is a programme of a SME consortium (ALI), coordinated scientifically by the University of Naples Federico II, which has the aim of developing a new deployable technology for atmospheric re-entry (for Earth or interplanetary missions).

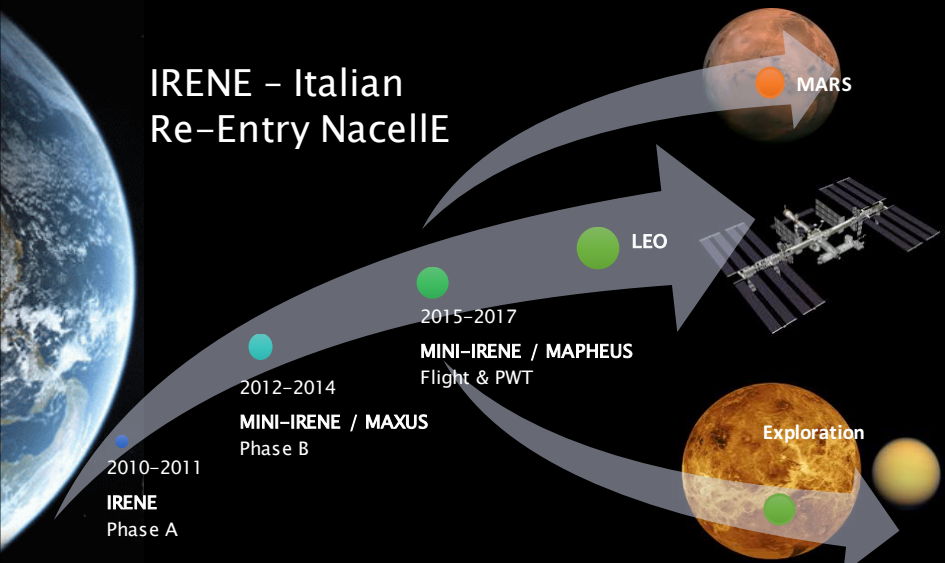

Mass [kg]	Payload [kg]	Max. Diameter [m]
130	40	3

Rome, 30th June – 1st July 2016
July 2016

IRENE Technological Project

IRENE – Italian Re-Entry Nacelle

The diagram shows a timeline of mission phases:

- 2010–2011**: IRENE Phase A
- 2012–2014**: MINI-IRENE / MAXUS Phase B
- 2015–2017**: MINI-IRENE / MAPHEUS Flight & PWT

 The timeline is represented by a large grey arrow pointing from Earth towards Mars and an 'Exploration' planet. Key orbital points are marked: LEO (Low Earth Orbit) and MARS.

TPS Materials

Ground-test model for the experimental test performed in Scirocco in 2011

Rescor 310 M ceramic foam was able to withstand up to 1550°C

Nextel 312 Ceramic woven fabric was able to withstand up to 1350°C in the Scirocco PWT

Sub-orbital flight demonstrators

Re-entry profiles comparison (LEO, MAXUS, MAPHEUS)

MISTRAL project: Aerospace District of Campania (DAC)

MISTRAL – MicroSaTellite con capacità di Rientro AvioLanciato

It is an innovative microsatellite system proposed by DAC and studied by companies, universities and research centers in Campania (Prime contractor is Telespazio)

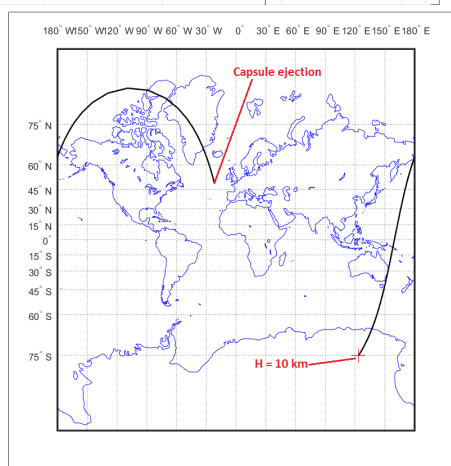

- It consist of a service module and a recoverable and deployable re-entry module
- The re-entry module is designed to be recoverable and deployable
- Fully recoverable and deployable
- Air-Launch compatible to ensure Operational Responsiveness
- A dedicated ground segment is under study

Mass [kg]	Payload [kg]	Max. Diameter [m]
30-50	1-2	1

Controlled De-Orbiting

Satellite's orbits below 160 km Nominal Trajectory Capsule trajectory from separation to ground

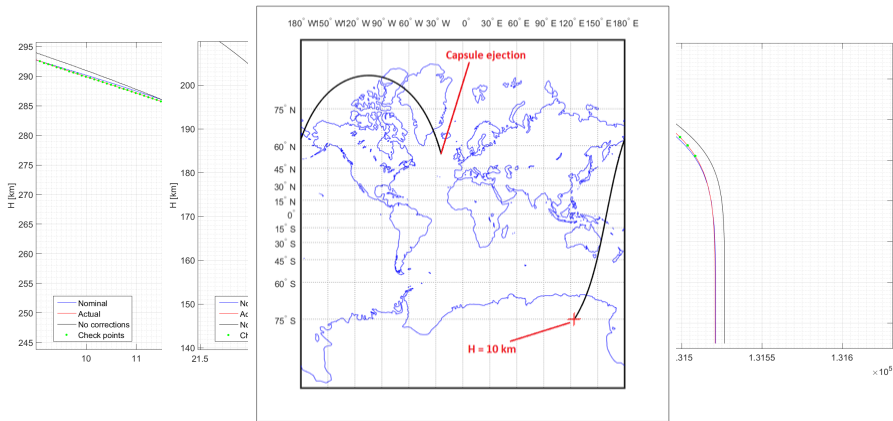

De-Orbiting

De-Orbiting control by aero-brake modulation

$$S = S_{ref} + k * (H_{eff} - H_{nom})$$

Hot reentry

Re-entry module aerothermodynamics

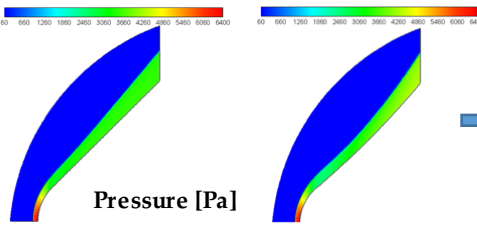

Temperature distribution (°C) during a possible re-entry trajectory

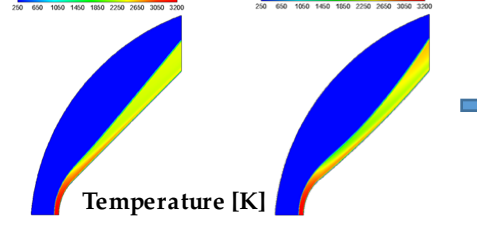

Aerothermodynamic analyses

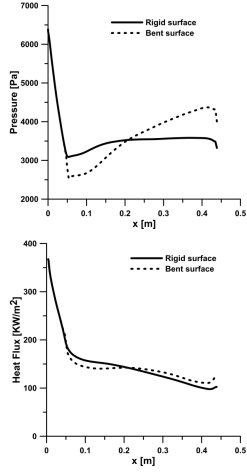

Air can be considered in chemical equilibrium, due to the relatively low energy profile

Pressure [Pa]

Temperature [K]

Other future applications: CubeSats

CubeSat End-Of-Life System (CELS)

- Reduce De-Orbit Lifetime (match the 25 years requirement);
- Contrast Space Debris with a passive aerobrake

CubeSat De-Orbit & Recovery System (CDRS)

- Recover scientific/electronic payloads and data;
 - Reduce costs with reusable hardware and subsystems
 - Perform post-flight inspections and experimentations
- Control de-orbit and re-entry trajectories (modulating the aerodynamic drag), to reach the desired landing site
